

MetGENE: Gene-centric Metabolomics Information Retrieval Tool

Sumana Srinivasan, Mano Ram Maurya, Srinivasan Ramachandran, Eoin Fahy and Shankar Subramaniam

CFDE: Gene Working Group
Biomedical Data Commons Workbench (BDCW)
Metabolomics Workbench DCC
University of California, San Diego

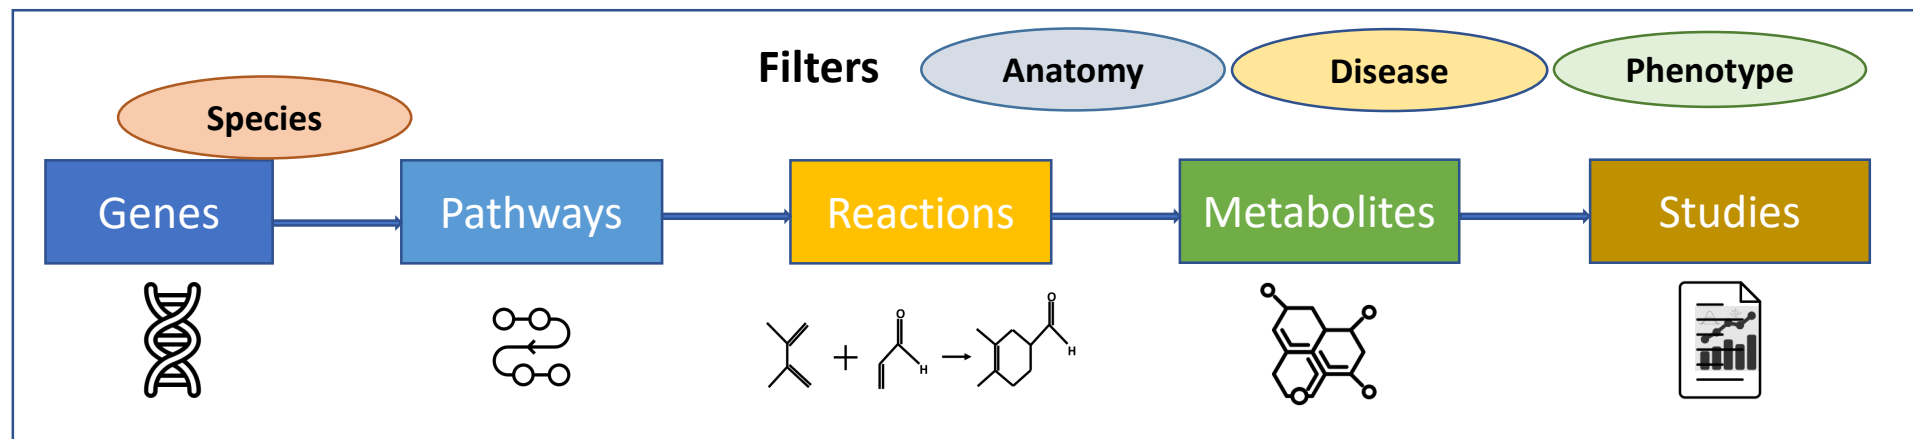

Funding: NIH Common Funds (Metabolomics Workbench and Common Fund Data Ecosystem (CFDE))

Motivation

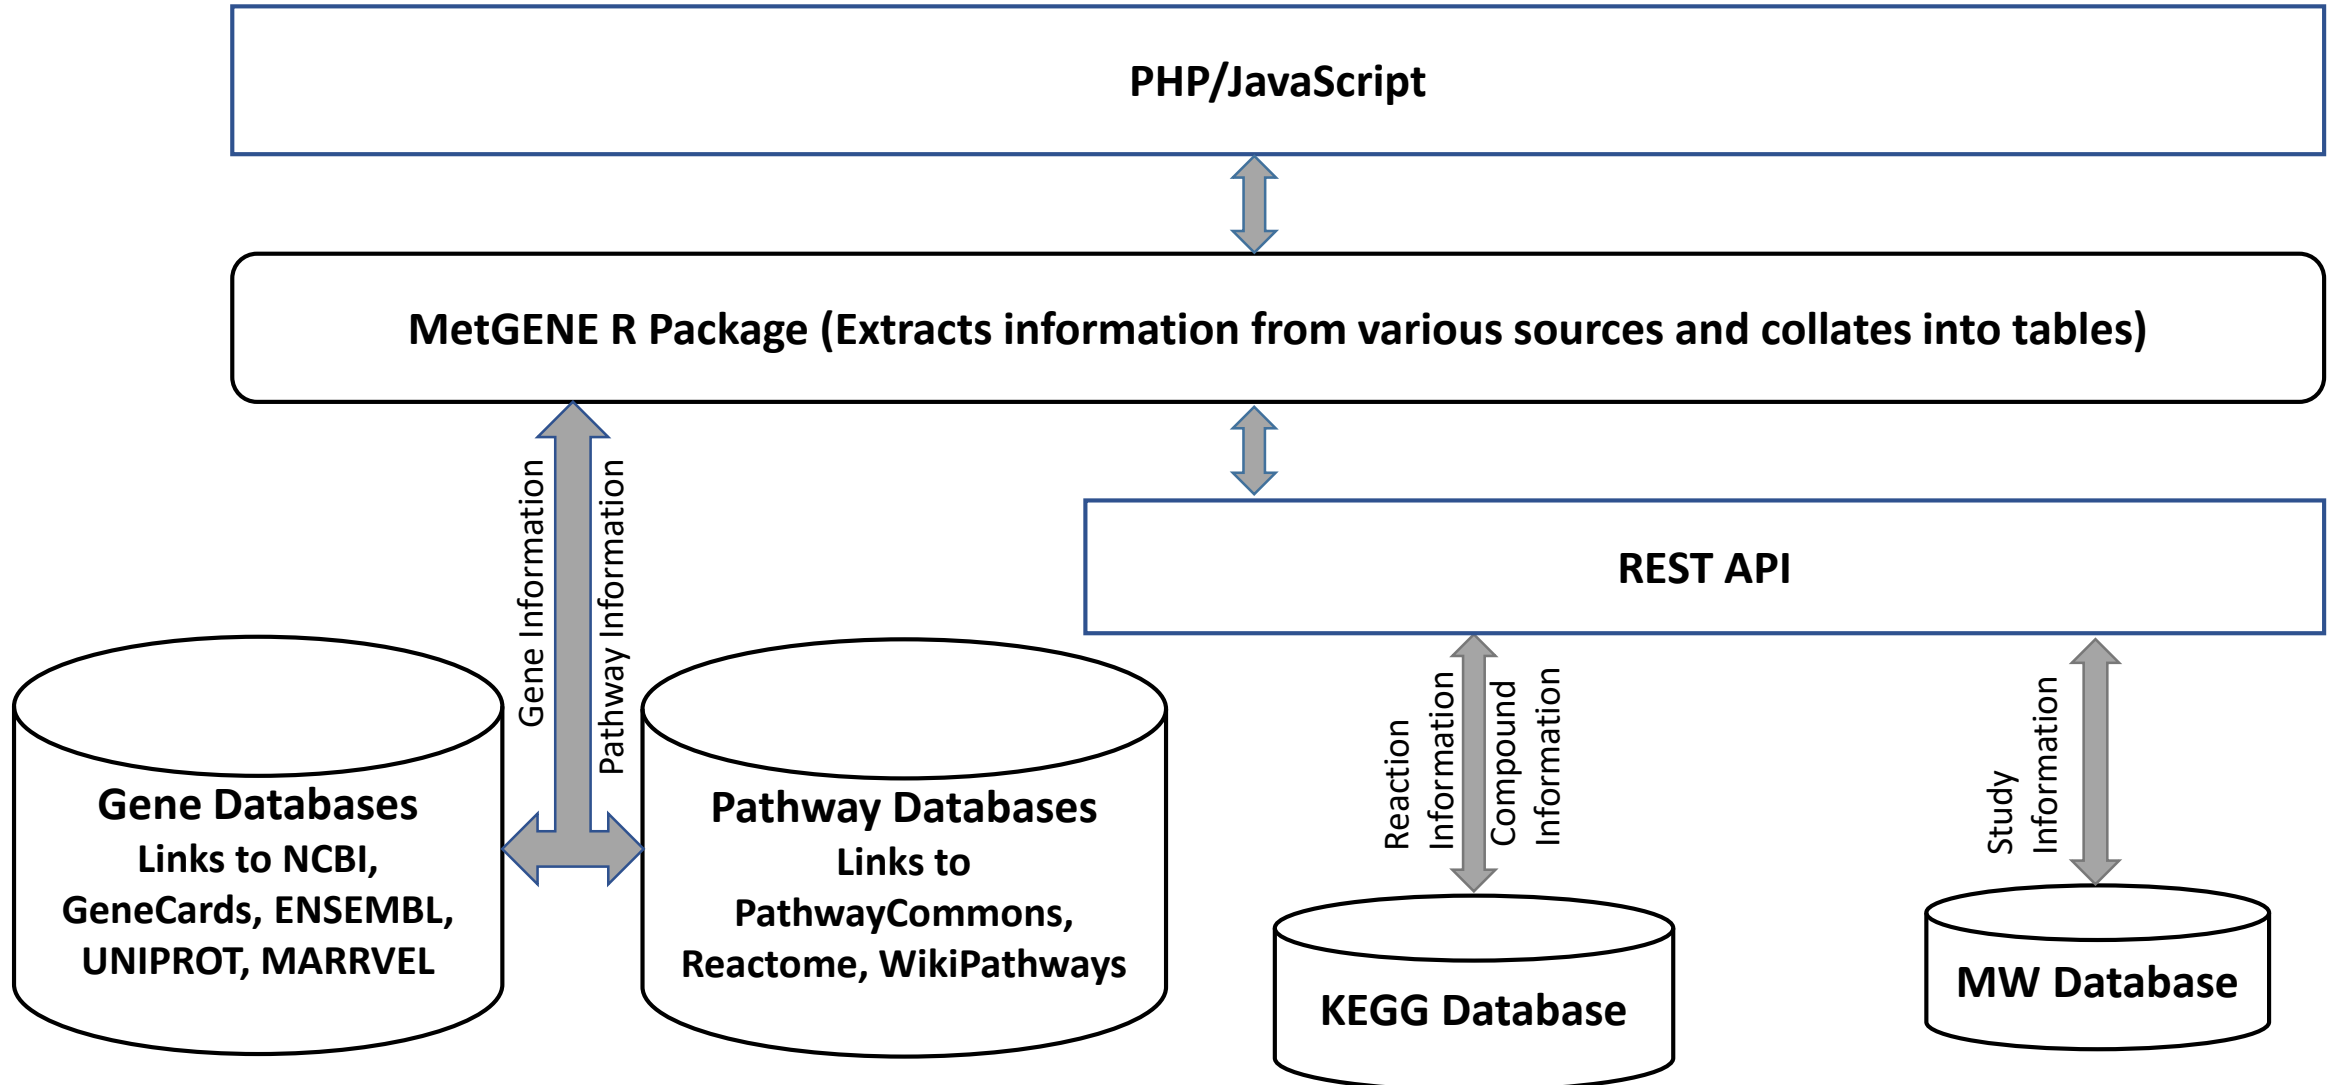

- Biomedical research involves integration of multiomics data contextually, to reconstruct networks, understand mechanisms, identify biomarkers and potential drug targets for drug design and therapy.
- Researchers need to access data and information from several diverse sources comprising of data in a variety of (and sometimes incomplete) formats.
- Next, the data and information are further analyzed and aggregated manually (or semi-automatically at best) with considerable effort in order to reconstruct networks, develop quantitative models and decipher mechanisms.
- MetGENE is a knowledge-based data integration tool that uses a hierarchical information retrieval approach to aggregate gene, pathway, reaction and metabolite and metabolomic study-centric data from various sources (such as KEGG and Metabolomics Workbench) under one dashboard, to enable ease of access by centralization of relevant information.

Gene to Metabolomic Studies

- MetGENE is a hierarchical, knowledge-based gene-centric information retrieval tool.
- Given one or more genes, the MetGENE identifies associations between the gene(s) and the metabolites that are biosynthesized, metabolized, or transported by proteins coded by the genes.
- The gene(s) link to metabolites, the chemical transformations involving the metabolites through gene-specified proteins/enzymes, the functional association of these gene-associated metabolites and the pathways involving these metabolites.

MetGENE Architecture

Features

- Client-side error handling and validation - gene search input is validated to allow only alphanumeric symbols. Invalid gene IDs are recognized, and appropriate error messages are displayed.
- Supports filtering based on
 - Taxonomy - Uses terms (e.g. Human, Mouse), as per the NCBI taxonomy database
 - Anatomy – Uses terms (e.g. Blood, Liver), from Uber-anatomy Ontology (Uberon)
 - Disease - Uses terms (e.g. Diabetes, Fatty liver disease) from Disease Ontology database
 - Phenotype (in progress) - Uses terms (e.g. BMI) from the Human Phenotype Ontology database
 - JSON files for each of these categories are curated and updated regularly to keep them current and use it to generate a two-step selection menu based on anatomy, disease and phenotype slim terms in the first level and corresponding anatomy, disease and phenotype terms in the second level for ease of presenting the options to the user.

Web based UI

- User can specify the gene using several gene ID types, such as SYMBOL, ENTREZ gene ID and ENSEMBL ID.
- Gene ID conversion tool translates these into harmonized IDs that are basis at the computational end for metabolite associations (data integration).
- All studies involving the metabolites associated with the gene-coded proteins, as present in the Metabolomics Workbench (MW), the portal for the NIH Common Fund National Metabolomics Data Repository (NMDR), will be accessible to the user through the portal interface.

Example: PNPLA3

- The *PNPLA3* gene encodes for the protein **adiponutrin**, found in fat and liver cells.
- Regulates the development of adipocytes and the production and breakdown of fats (lipogenesis and lipolysis).
- Diseases associated with PNPLA3 include Fatty Liver Disease and Non-Alcoholic Steatohepatitis.
- Pathways: Metabolism and Glycerophospholipid biosynthesis.

Welcome to the MetGENE Tool

Given one or more genes, the MetGENE tool identifies associations between the gene(s) and the metabolites that are biosynthesized, metabolized, or transported by proteins coded by the genes. The gene(s) link to metabolites, the chemical transformations involving the metabolites through gene-specified proteins/enzymes, the functional association of these gene-associated metabolites and the pathways involving these metabolites.

The user can specify the gene using a multiplicity of IDs and gene ID conversion tool translates these into harmonized IDs that are basis at the computational end for metabolite associations. Further, all studies involving the metabolites associated with the gene-coded proteins, as present in the Metabolomics Workbench (MW), the portal for the NIH Common Fund National Metabolomics Data Repository (NMDR), will be accessible to the user through the portal interface. The user can begin her/his journey from the NIH Common Fund Data Ecosystem (CFDE) portal. A tutorial for MetGENE is available [here](#).

MetGENE

Gene-centric Metabolomics Information Retrieval Tool

Home Genes Pathways Reactions Metabolites Studies

Provides context and can be navigated

In the MetGENE tool, information about the gene(s) PNPLA3 is presented in **Genes**, the corresponding pathways in **Pathways** and the reactions in **Reactions** tabs. The metabolites participating in the reactions are presented in **Metabolites** tab. For each metabolite, the studies containing the metabolite are identified from the **Metabolomics Workbench** (MW) and presented in **Studies** tab.

The data from MW studies are presented as table(s), with the metabolite names hyperlinked to MW **RefMet** page (or to the corresponding **KEGG** entry in the absence of a RefMet name) for the metabolite, reaction hyperlinked to its KEGG entry and MW studies hyperlinked to their respective pages. The user also has access to the metabolite statistics via **MetStat**. Further, the user has the option to select more than one metabolite to list only those studies in which all the selected metabolites appear and can download the table as a text, HTML or JSON file.

Function¹

Specifically catalyzes coenzyme A (CoA)-dependent acylation of 1-acyl-sn-glycerol 3-phosphate (2-lysophosphatidic acid/LPA) to generate phosphatidic acid (PA), an important metabolic intermediate and precursor for both triglycerides and glycerophospholipids. Does not esterify other lysophospholipids. Acyl donors are long chain (at least C16) fatty acyl-CoAs: arachidonoyl-CoA, linoleoyl-CoA, oleoyl-CoA and at a lesser extent palmitoyl-CoA (PubMed:22560221). Additionally possesses low triacylglycerol lipase and CoA-independent acylglycerol transacylase activities and

MARRVEL About FAQ Feedback API

PNPLA3

UCSC Genome Browser HGNC NCBI Gene MyGene2

Gene Name patatin like phospholipase domain containing 3
Gene Aliases ADPN, C22orf20, iPLA2(epsilon)

Entrez Summary of PNPLA3

The protein encoded by this gene is a triacylglycerol lipase that mediates triacylglycerol hydrolysis in adipocytes. The encoded protein, which appears to be membrane bound, may be involved in the balance of energy usage/storage in adipocytes. [provided by RefSeq, Jul 2008]

DISEASE DATA

OMIM [More on OMIM](#)

There are **0 phenotype** associated with PNPLA3 and **0 reported allele** from OMIM. Since there is no reported phenotype associated, there is an opportunity to provide a phenotypic expansion.

OMIM Description of PNPLA3

PATATIN-LIKE PHOSPHOLIPASE DOMAIN-CONTAINING PROTEIN 3; PNPLA3

By mRNA differential display to identify genes involved in adipose conversion of mouse preadipocyte cell lines, Baulande et al. (2001) cloned mouse Pnpla3, which they called Adpn. The deduced protein contains 412 amino acids. [PubMed analysis: Baulande et al. (2001)]

Study ID ST001710

Study Title Metabolic signatures of NAFLD - Lipidomics data (part 1 of 3)

Study Summary Serum samples were randomized and extracted using a modified version of the previously-published Folch procedure, as applied recently [20]. The maternal samples were analysed as one batch and the cord blood samples as a second batch. In short, 10 μ L of 0.9% NaCl and, 120 μ L of CHCl₃: MeOH (2:1, v/v) containing the internal standards (c = 2.5 μ g/mL) was added to 10 μ L of each serum sample. The standard solution contained the following compounds: 1,2-diheptadecanoyl-sn-glycero-3-phosphoethanolamine (PE(17:0/17:0)), N-heptadecanoyl-D-erythro-sphingosylphosphorylcholine (SM(d18:1/17:0)), N-heptadecanoyl-D-erythro-sphingosine (Cer(d18:1/17:0)), 1,2-diheptadecanoyl-sn-glycero-3-phosphocholine (PC(17:0/17:0)), 1-heptadecanoyl-2-hydroxy-sn-glycero-3-phosphocholine (LPC(17:0)) and 1-palmitoyl-d31-2-oleoyl-sn-glycero-3-phosphocholine (PC(16:0/d31/18:1)), were purchased from Avanti Polar Lipids, Inc. (Alabaster, AL, USA), and, triheptadecanoylglycerol (TG(17:0/17:0/17:0)) was purchased from Larodan AB (Solna, Sweden). The samples were vortex mixed and incubated on ice for 30 min after
